

It's not waste. It's energy.

# View port

Optical control ensured by clear vision.

The AAT View ports are used to look inside various containers, tanks and shafts in biogas plants.

By means of the view port, the contents, the fermentation, the function of the agitators and similar things can be controlled optically.

They are fitted directly to the ceiling, the outside wall and/or maintenance shaft. Sometimes they can be opened by quick-action locks and they have a protective cover.

An integrated washing nozzle (in case of non-opening view ports) and a wiper ensure that dirt caused by the content can be removed quickly.

The view ports are closed gas-tight by resisting rubber seals and are considered technically tight.

High-quality materials are used and the glass as well as the frame are extremely steadfast. Depending on equipment, different sizes are available.

#### Advantages:

- ✓ Material: Stainless steel (1.4571), light metal and toughened safety glass 8mm
- ✓ Gas-tight (EPDM seal)
- ✓ Integrated washer jet (view ports that cannot be opened)
- ✓ Integrated wipers approx. 0.15 bar
